                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of identifying an agent that increases nonsense suppression, by contacting modulator of translation termination (MTT1) also referred to as helicase B (HCSB) in Saccharomyces cerevisiae. The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae MTT1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Saccharomyces
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying an agent that increases nonsense suppression, for antiviral therapy, by contacting modulator of translation termination (Mttl) in Saccharomyces cerevisiae with a test agent, and detecting specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-OCT-2003.

the RNA helicase MTT1 with a composition or agent under conditions
CC permitting binding between the MTT1 and the composition, detecting
CC specific binding of the test composition or agent under conditions
CC determining if the test composition or agent inhibits the MTT1, and
CC composition and methods are useful for modulating the fidelity of
CC translation termination or for identifying agents that: affect the
CC functional activity of mRNAs by altering frameshift frequency, permit
CC transcripts, and provide modulators (inhibitors/stimulators) of peptidyl
CC transferase activity during initiation, elongation, termination and mRNA
CC degradation of translation. The agents which may be antagonists or
CC agonists, are useful in screening, diagnostic and therapeutic purposes,
CC of diseases or conditions resulting from or cause premature translation,
CC such as beta-thalassaemia, beta-globin, Duchenne/Becker Muscullar
CC Osteogenesis Imperfecta, Breast cancer, Ovarian Cancer, Wilms Tumour,
CC Hirschaprung disease, Cystic fibrosis, Kidney Stones, Pamilial
CC Hypercholesterolaemia, Retinitis Pigmentosa, or Neurofibromatosis,
CC Retinoblastoma, ATM or Costmann Disease. The present sequence represents

CC the amino acid sequence of the yeast helicase Mtt1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC comprising the recombinant DNA construct and a method of producing a CC transformed plant having an improved property. The plant is a crop plant CC such as maize or soybean. The method of producing a transformed plant CC having an improved property comprises transforming a plant with the CC recombinant DNA construct and growing the transformed plant, where the CC polynucleotide or polypeptide is useful for improving plant properties. CC The recombinant DNA construct is useful for producing plant with the CC improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of CC content, improved yield by modification of carbohydrate, nitrogen or CC content, improved plant growth and development under at least one stress CC condition, improved plant growth and development under at least one stress CC condition, improved lignin production or improved galactomannan CC production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part form in the printed specification but was obtained in electronic condition.
                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                 CC promoter functional in a plant cell, where the promoter is positioned to comprising the recombinant DNA construct and a method of producing a crop plant cell. CC comprising the recombinant DNA construct and a method of producing a crop plant cC transformed plant having an improved property. The plant is a crop plant cC such as maize or soybean. The method of producing a transformed plant cC having an improved property comprises transformed plant cC having an improved property comprises transforming a plant with the crop plant DNA construct and growing the transformed plant, where the cC polymucleotide or polypeptide is useful for improving plant properties. CC improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, concreased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth rate growth rate of homologous recombination, modified seed oil or protein yield and/or cC content, improved yield by modification of carbohydrate, nitrogen or cphosphorus use and/or uptake, by modification of carbohydrate, nitrogen or content, improved plant growth and development under at least one stress condition, improved lighin production of carbohydrate, nitrogen or conduction. This sequence erepresents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not corm part of the printed specification but was obtained in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                       Matches
                                                                                                         Query Match
                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a recombinant DNA construct comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; SEQ ID NO 12790; 122pp; English.

                                                                                                                                S
                                                                                                                                                                                                                                                                                                 cc peptidyl transferase activity during translation, inhibiting the complex comprising polynucleotides encoding the complex comprising polynucleotides encoding the complex (or contrasters enquences) can be constructed and introduced into cells to interfere with complex expression and so modulate the efficiency of transcripts in a cell. Agents binding to the complex can be identified concluded in therapeutic compositions useful as above, and/or used to modulate peptidyl transferase activity during translation in cells. They care also useful to modulate the efficiency of transcripts in cells. The method can be used to identify agents/c compositions modulating binding to MTT1, useful to identify agents/c compositions modulating binding to MTT1, useful to identify agents/c repoint 1 helicases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            peptidyl transferase activity during translation. The complex comprises the gene encoding Helicase B (HCSB; renamed MTT1, for Modulator of Translation Termination) and the conserved proteins known to interact and carry out translation termination in eukaryotic cells, peptidyl celkaryotic release factor (eRF) l and eRF3. The complex can be used to modulate peptidyl transferase activity during translation in a cell. It can be administered therapeutically combined with a carrier in pharmaceutical compositions to treat diseases associated with peptidyl transferase activity, especially diseases resulting from a nonsense or frameshift mutation e.g. beta-thalassemia, beta-globin, Duchene/Becker Muscular Dystrophy etc. It can be used to identify disease conditions involving a defect in the complex, by transferting cells with encoding nucleic acid and determining the proportion of defective complex before and after transfection. It is also useful to screen for drugs involved in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of identifying an agent that increases nonsense suppression, by contacting modulator of translation termination (MTT1) also referred to as helicase B (HCSB) in Saccharomyces cerevisiae. The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae SEN1 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying an agent that increases nonsense suppression, for antiviral therapy, by contacting modulator of translation termination (Mtt1) in Saccharomyces cerevisiae with a test agent, and detecting specific

                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of identifying a test composition that CC modulates the efficiency of translation termination comprising contacting the RNA helicase MTTI with a composition or agent under conditions comparising the test composition or agent to the MTTI. The CC determining if the test composition or agent inhibits the MTTI. The CC composition and methods are useful for modulating the fidelity of composition or agent inhibits the MTTI. The CC translation termination or for identifying agents that: affect the CC functional activity of mRNAs by altering frameshift frequency, permit contring of a termination event, promote degradation of aberrant CC transferse activity during initiation, elongation, termination and mENNA CC degradation of translation. The agents, which may be antagonists or CC agonists, are useful in screening, diagnostic and therapeutic purposes, CC for diseases or conditions resulting from or cause premature translation, CC such as beta-thalassaemia, beta-globin, Duchenne/Becker Muscular CC such as meaning disease, Cystic fibrosis, Kidney Stones, Familial CC hypercholesterolaemia, Retinitis Pigmentosa, or Neurofibromatosis, CC Retinoblastoma, ATM or Costmann Disease. The present sequence represents or the amino acid sequence of the yeast helicase Sen1.
                                                                                                                                                                                                                                                                                                               Matches

The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bauer A,

The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament for the treatment or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was obtained from the EPO in electronic format).

The invention relates to a recombinant DNA construct comprising a CC promoter functional in a plant cell, where the promoter is positioned to microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a CC comprising the recombinant DNA construct and a method of producing a crop plant cc such as maize or sybean. The method of producing a transformed plant cc such as maize or sybean. The method of producing a transformed plant cc having an improved property comprises transforming a plant with the crecombinant DNA construct and growing the transformed plant, where the cc polynucleotide or polypeptide is useful for improving plant properties. CC intercombinant DNA construct is useful for producing plants with the recombinant DNA construct is useful for producing plants with the cc inproved plant properties, e.g. improved cold, heat or drought tolerance, comprises transformed plant, where the cc increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth rate by modification of the cell cycle pathway with plant growth rate by modification or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by production, improved lignin production or improved galactomannan cc condition, improved lignin production or improved galactomannan cc condition. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic cc format from USPFO at sequence data for this patent did not compare the printed specification but was obtained in electronic cc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         S

                                                                                                                                                                                                                                                                                                                              contiguous amino acids of any of the above, an one-contiguous amino acids of any of the above-mentioned amino acid so fany of the above-mentioned amino acid conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing to measure gene expression, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene expression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising smaller genomic alterations, in detecting and characterising gross alterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human can be succeed in electronic format directly from USPTO at sequence in electronic format directly from USPTO at sequence.html?Doc1D=20030194704

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
